

I am a third-year Computer Science student with a minor in bioinformatics, so I am really interested in the convergence of CS, math, and biology. Within this realm, user experience is extremely important: understanding what users want and need, receiving and implementing feedback, and having the user in mind when creating products. I am also passionate about art and design and would love to have more experience combining these two. I did some UI/UX in my CSC 308/309 classes, but I am eager to learn more and develop new skills.
